

Skinning Daisy

Ideas

- Creating a Gallery of daisy skins available for download.
- Better documentation of all the variables available in the xlst (especially layout.xsl)
- Way to add more variables to skinconf.xml to make more flexible skins for those of us who host multiple similar sites
- Create more stylesheets and separate various functions
 - example (from discussion)
 - reset.css - contains tags that reset all margins, padding, font size etc. to give you a browser independent starting point
 - layout.css - contains only layout related attributes (margins, padding etc.)
 - typography.css - contains only font related attributes (font, size, text alignment etc.)
 - graphics.css - contains only colors and graphics (background, borders, colors etc.)
 - doctypespecific.css - contains specific styling for one or more documentTypes.
style.css is basically the file that call it all:

```
@import reset.css  
@import layout.css  
@import typography.css  
@import graphics.css
```
 - Current UCSF Model
 - layout.css - contains only layout related attributes (margins, padding etc.)
 - color.css - contains only colors and graphics (background, borders, colors etc.)
 - fonts.css - contains only font related attributes (font, size, text alignment etc.)
